RWM

The ROME Window Manager (RWM) implements a simple window manager functionality for ROME. It works closely together with GIA and should, in fact, be integrated into GIA sooner or later.

However, for the time being it is implemented in a separate module.

Module Options

RWM_DEBUG	Enables debug output for RWM.

Data definitions

There are no public data definitions in RWM.

Shared Library Macros and Routines

rwm_init

void *rwm_init*(
void)

The *rwm_init* function should be called before any other RWM functions. This function initializes RWM internal structures and prepares RWM for operation. Usually an application has not to worry about initializing RWM, as GIS takes full control of all RWM functionality, including RWM initialization.
